

# Fortification at the Mill

Quality Assurance & Process

Control at the Mill

Quentin Johnson

(with contributions from

Philip Randall)

# Quality Assurance Definition

A system to control all parts of the milling process to ensure the consistent production of flour that meets both regulatory and commercial requirements.

Process control of Fortification at the mill is a key component of the Quality Assurance system

# Process Control in Flour Fortification

- Flour fortification needs process controls to ensure consistent quality and safety of the output: flour adequately fortified with essential minerals and vitamins.
- Effective process control systems use mechanisms to monitor activities and take timely corrective action.
- Well implemented process control gives an early warning of problems which in turn helps to avoid wastage, reworking of product, customer complaints, food recalls and liability issues etc

# Quality Assurance Fortification Mill Requirements and Responsibilities

- Premix procurement and storage
- Feeder/Dosifier Installation
- Feeder Calibration
- Feed Rate Calculations
- Process controls
  - Check Weighing, standards and sampling schedule
  - Iron Spot Test
- Record Keeping
- Laboratory Analysis
  - Quantitative test for Iron and Vitamins

# Ultimate Process Control of Flour Fortification

- Modern mills with computer control systems
- Automatic feeder –flour scale feedback systems controlling the process
- Premix release system
- Stock Reconciliation method on weekly or monthly basis
- Iron spot test used as mill QC tool
- Good access to qualified laboratories for quantitative analysis for monitoring

# Acceptable Process Control of Flour Fortification

- Manual feeder operations – volumetric type feeders
- Interlocked with either 1<sup>st</sup> Break sifter or flour collection conveyor motor
- Feeder Calibration
- Check weighing 2 – 4 times per shift
- Iron Spot Test
- Premix release system
- Stock Reconciliation method on weekly or monthly basis
- Access to outside testing laboratory

# Premix Procurement and Storage

- Premix specifications or standards
- Approved supplier list at least 2 suppliers
- Purchase and storage records
- Cool dry storage room or area (A/C possible)
- Stock rotation First In First Out system
- Usage records including premix lot numbers

# Feeder Placement - Gravity Feed System

Feeder is placed above flour collection conveyor.

**MUST BE 3 METERS FROM DISCHARGE END OF CONVEYOR**

Premix falls directly into the flour as it flows through the conveyor.

Feeder is usually placed above or near the flour collection conveyor that blends the various flour streams.

# Feeder Placement Pneumatic System

Premix drops into a venturi tube, that injects the premix into an air stream.

Premix is blown by positive pressure or sucked by a vacuum through a pipe into the flour collection conveyer.

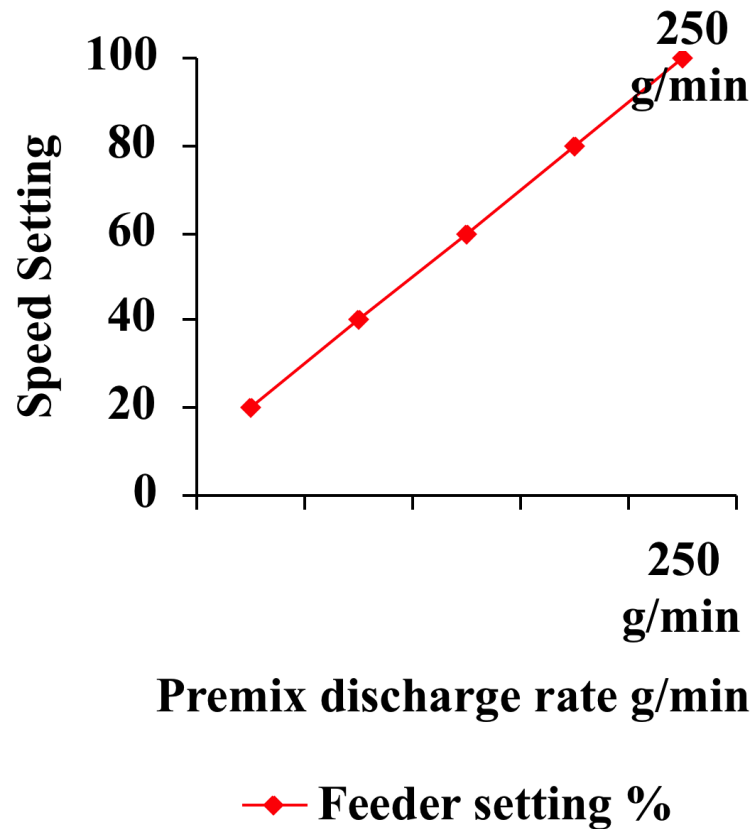

Occasionally downstream location in the flour flow can be used to add premix provided it will be well mixed with the flour.

# FEEDER SIZING AND FEED RATE CALCULATIONS

Mill Size	60 MT	100 MT	200 MT	360 MT
Flour	45	75	150	187.5
Kg/min	31.25	52.08	104.17	347
Premix	200 g/MT	200 g/MT	200 g/MT	200 g/MT
Add Rate	6.25 g/min	10.6 g/min	20.8 g/min	69.4 g/min
Premix use	3.0 kg/ 8 hr	5.1 kg/ 8 hr	9.9 kg/ 8 hr	33 kg/ 8 hr

# Feeder Calibration

- Direct Drive Motors
- Volumetric Feeders
- Determine minimum and maximum discharge for premix
- Premix weight and volume based on density of components

# Feeder Problems - Diagnosis

# Feeder Problems - prevention

- Bridging – use of stirring device inside feeder hopper – agitator or screw mixing
- Tunneling – use of stirring device
- Mill stops, feeder continues – electrical interlock between mill and feeder
- Feeder empty or stops – audible alarm system

# FORTIFICATION AT THE MILL

## Equipment requirements

- Collection Conveyor with Paddles or cut/folded flights (maximize agitation)
- Feeder with mechanical or electronic controls to adjust feed rates
- Conveying system to deliver premix to flour
- Weigh Scale to verify premix addition rates (QC check)

# Iron Spot Test Diagram

## Iron Spot Test (AACC Method)

**Sample**

**30 ppm**

**60 ppm**

**90 ppm**

Based on spot intensity:  
The sample has between 60-90 ppm of added Iron

# Premix Control Records

- Why?
- To verify that premix is being added at the correct levels using inventory control system.
- Can be calculated weekly or monthly

# Premix Control Record Calculation

- A. Starting Inventory kg
- B. Amount purchased kg
- C. Ending Inventory kg
- D. Amount used (A+B-C) kg
- E. Fortified Flour produced MT
- F. Actual Addition Rate (D/E x 1000) g/MT
- G. Target Rate\* g/MT
- H. Percent of Target (F/G x 100) %
- \* Based on supplier specifications

# Accuracy of system

## WFP Afghanistan Example

- 3 mills in Peshawar and Quetta
- Flour milled for WFP Afghanistan's Women's Bakery Project 1999-2005
- Based on premix stock release system tied to flour orders
- Final assessment
- Premix addition was within  $\pm 3.0\%$  of target addition rate
